

IT Infrastructure Consolidation

Integrating Entity 2 into Entity 1's Operational Landscape

Consolidation Strategy Overview

Objective

To seamlessly integrate Entity 2 into Entity 1's IT landscape, unifying operations into a single, standardized, and highly efficient corporate infrastructure.

Key Benefits

Drive significant cost reduction, establish unified IT governance, streamline operational support, and drastically enhance our overarching security posture.

Project Scope

Complete integration across five primary pillars: Enterprise Network, End User Services, Data Center Operations, IT Support Service, and Security Tools.

Current State Architecture Footprint

Branch Location	Entity 1 (Target State)	Entity 2 (Legacy State)
Branch A	 Regional Office  Primary Data Center	 Regional Office  Primary Data Center
Branch B	 Regional Office  Secondary Data Center	 Regional Office  Secondary Data Center
Branch C	 Regional Office  Edge Data Center	 Regional Office  No Local DC Presence

Note: The current environment consists of duplicated infrastructure across Branches A and B, requiring immediate physical and logical reconciliation.

Future State Target Architecture

Physical Consolidation

- **Unified Branches:** Merge duplicate physical offices in Branches A, B, and C into single, high-capacity regional hubs.
- **Data Center Optimization:** Decommission Entity 2's data centers in Branches A and B.
- **Centralized Hosting:** Branch C relies entirely on the robust, consolidated Entity 1 Data Centers located in Branches A and B.

Logical Consolidation

- **Single Domain:** All systems and users migrated to a singular, unified Active Directory forest.
- **Unified Routing:** Simplified internal routing protocol with redundant, high-speed SD-WAN fabric connecting all 3 branches.
- **Centralized Perimeter:** All ingress/egress internet and cloud traffic routed through centralized security gateways.

Domain Consolidation Plans

Detailed integration strategies across the five core technical pillars.

Network Services Consolidation

Merging disparate networks requires standardizing routing, expanding bandwidth, and securing perimeters.

- Integrate Branch A, B, and C legacy networks into the primary SD-WAN fabric.
- Decommission redundant ISP links to achieve immediate operational cost savings.
- Harmonize IP addressing schemas to prevent overlap and ensure seamless routing.
- Establish a unified secure perimeter, migrating all VPN users to a single remote access gateway.

End User Services

Unified Digital Workspace

We will migrate all Entity 2 personnel into Entity 1's standard Active Directory and M365 tenant.

This integration guarantees standardized workstation images, unified communication tools, and a seamless, modern digital experience for all consolidated employees.

Data Center Operations Consolidation

enter server rack aisle

Workload Migration & Decommissioning

The core objective is to eliminate redundant hardware footprint and centralize compute power within Entity 1's premier facilities.

- Migrate critical virtualized workloads from Entity 2 to Entity 1's clusters in Branch A and B.
- Consolidate enterprise storage arrays and unify backup & disaster recovery policies.
- Safely decommission legacy Entity 2 server hardware and terminate extraneous facility leases.

IT Support & Service Management

Unified ITSM Platform

Consolidate all ticketing, incident management, and change requests into a single IT Service Management platform, completely retiring legacy helpdesk tools.

Single Service Desk Portal

Provide all employees with one centralized self-service portal and a unified contact number, ensuring a standardized, frictionless support experience regardless of branch location.

Harmonized SLAs

Standardize Service Level Agreements (SLAs), escalation matrices, and support tiering across the new unified organization to guarantee consistent service delivery.

Cybersecurity Tool Standardization

A unified infrastructure demands a unified defense. We are harmonizing security toolsets to close visibility gaps and enforce compliance.

- Deploy standardized Endpoint Detection and Response (EDR) agents to all inherited Entity 2 devices.
- Integrate all logs, networks, and identities into a single centralized SIEM dashboard.
- Unify Identity and Access Management (IAM) policies with mandatory Multi-Factor Authentication (MFA).
- Standardize Next-Gen Firewalls across all Branch A, B, and C locations.

Projected Execution Timeline

Questions?

Thank you for your time and engagement.
